

In science, Rabbits were exploring sound and the pitch that objects made. Using their enquiry type of pattern seeking, they were able to identify the patterns between the objects and the pitches of the sound they made, they made the following conclusions:

The larger the key the lower the pitch.

The more water in the bottle the higher/lower the pitch

The less fingers on the recorder the higher the pitch.

The tighter the drum skin, the higher the pitch.

The tighter the elastic band the higher the pitch.
